No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Description

                                                                                                                                           The invention relates to the design of trimeric polypeptides using polypeptide structural elements derived from the tetranectin protein (Emily: The trimeric polypeptides constructed as a monomer polypeptide construct comprise at least one tetranectin trimeric polypeptide construct comparise at least one tetranectin trimeric polypeptide construct comparise at least one tetranectin trimerising structural element (TTSE) which is covalently linked to at least one heterologous moiety, the TTSE being capable of forming a stable complex with 2 other TTSEs, with the proviso that the heterologous moiety is different from any of the fusion proteins CIHGEXTN123, HGEXTN123, HGEXTN12 HGEXTN23 (AAMW94261) The TTSE can be used for the construction of conjugates with heterologous moleties such as a ligand binding structure, a toxin, a detectable label, an in situ activatable substance, an enzyme, a radioactive moiety, a cytchine, an on-proteinaceous polymer, or a proty facilitating conjugation of the paperic or a photo cross-linking agent, or a group facilitating conjugation of the operies for generating chimmer; artificial antibodies having constructs can be used for targeted gene therapy involving selective constructs can be used for transfection or infection of the specific population of cells. They can also be used for delivering a substance to a cell or tissue or for delivering an imaging or toxin-conjugated cat as a vehicle for a wide variety of conjugates. The present sequence cat as a vehicle for a wide variety of conjugates. The presents a HGEXTN23 fusion protein sequence. The specification claims the heterologous moiety to which the TTSEs of the invention are linked to is specifically different from the present fusion protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

structure, a toxin, a detectable label, an in situ activatable substance, an enzyme, a radioactive moiety, a cytokine, a non-proteinaceous polymer, a photo cross-linking agent, or a group facilitating conjugation of the monomer polypeptide construct to a target. They can be used as vehicles for assembling antibody fragments into oligomeric or multivalent entities for generating chimeric artificial antibodies having
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  population of cells. They can also be used for delivering a substance to a cell or tissue or for delivering an imaging or toxin-conjugated antibody to a tumour. They can also be used for prevention or treating a disease or for diagnosis. The TrSE provides a stable structure which can act as a vehicle for a wide variety of conjugates. The present sequence represents a human tetranectin sequence from which the TTSE can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Trimeric polypeptide; tetranectin trimerising structural element; TTSE; fusion protein; ligand binding structure; toxin; enzyme; cytoKine; artificial antibody; pharmacoKinetic; pharmadynamic; gene therapy; transfection; imaging; tumour; human; tetranectin; H6FXTN123.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to the design of trimeric polypeptides using polypeptide structural elements derived from the tetranectin protein family. The trimeric polypeptides constructed as a monomer polypeptide construct comprise at least one tetranectin trimerising structural.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      element (TTSE) which is covalently linked to at least one heterologous molety, the TTSE being capable of forming a stable complex with 2 other TTSEs, with the proviso that the heterologous molety is different from any of the fusion proteins CIH6FXTN123, H6FXTN123, H6FXTN12, H6FXTN12 (AAW94261 to AAW94264). The TTSE can be used for the construction of conjugates with heterologous moleties such as a ligand binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                preselected pharmacokinetic and/or pharmadynamic properties. The constructs can be used for targeted gene therapy involving selective delivery of the material for transfection or infection of the specific

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ŏ
                                                                                                                                                                                                                                                                                                                                 The invention relates to the design of trimeric polypeptides using polypeptide structural elements derived from the tetranectin protein family. The trimeric polypeptides constructed as a monomer polypeptide construct comprise at least one tetranectin trimerising structural element (TTSE) which is covalently linked to at least one heterologous moiety, the TTSE being capable of forming a stable complex with 2 other TTSEs, with the provise that the heterologous moiety is different from any of the fusion proteins CIIH6FXTN123, H6FXTN123, H6FXTN12, H6FXTN2 (AAM94261 to AAM94264). The TTSE can be used for the construction of conjugates with heterologous moiety such as a ligand binding structure, a toxin, a detectable label, an in situ activatable substance, an enzyme, a radioactive moiety, a cytokine, a non-proteinaceous polymer, a photo cross-linking agent, or a group facilitating conjugation of the monomer polypeptide construct to a target. They can be used as vehicles for assembling antibody fragments into oligomeric or multivalent constructs can be used for transfection or milective constructs can be used for transfection or infection of the specific population of calls. They can also be used for delivering a substance to a call or tissue or for delivering an imaging or toxin-conjugated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antibody to a tumour. They can also be used for prevention or treating a disease or for diagnosis. The TTSE provides a stable structure which can act as a vehicle for a wide variety of conjugates. The present sequence represents a H6FXTN123 fusion protein sequence. The specification claims that the heterologous moiety to which the TTSEs of the invention are linked to is specifically different from the present fusion protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                             New monomer polypeptide constructs for diagnosis and therapy comprise a tetranectin trimerising structural element covalently linked to at least one heterologous moiety for providing functional

cDNA encoding human tetranectin (full sequence given in AAR6051) was PCR amplified cDNA was linked to a sequence encoding the Factor-Xa cleavage site (given in AAR60503), subcloned in vector pT7H6 so that it was linked to a hexahistidine-encoding sequence and expressed in E. coli BL1. The fusion protein was purified on an Ni2+-activated NTA-agarose column. A cyclic procedure was used to obtain correctly folded recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; sheep; pig; cow; fruit fly; yeast; hamster; macaque; horse; tomato; monkey; dog; sea urchin; expressed sequence tag; EST; diagnostics; forensic test; gene mapping; genetic disorder; biodiversity; gene therapy; nutrition.

                                                                                                                                                                     The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, foremsics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a protein of the invention.

The invention relates to the design of trimeric polypeptides using polypeptide structural elements derived from the tetranectin protein camily. The trimeric polypeptides constructed as a monomer polypeptide construct comprise at least one tetranectin trimerising structural element (TTSE) which is covalently linked to at least one heterologous construct comprise at least one tetranectin trimerising structural element (TTSE) which is covalently linked to at least one heterologous conject, the TTSE bank the proviso that the heterologous moiety is different from TTSEs, with the proviso that the heterologous moiety is different from any of the fusion proteins CIH6FXTN123, H6FXTN12, H6FXTN13, H7FTSE provides a stable structure which can tail of the present sequence represents a CIH6FXTN13 fusion protein sequence. The present fusion protein sequence. Claims that the heterologous moiety to which the TTSEs of the Invention sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
New monomer polypeptide constructs for diagnosis and therapy comprise a tetranectin trimerising structural element covalently linked to at least one heterologous moiety for providing functional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Plasminogen activation; clot lysis; fibrinolysis; tissue growth;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

constitute Compilise a teast one telemettin timestainy structures.

Compilise a teast one telement a stable complex with 2 other TTSE being capable of forming a stable complex with 2 other TTSEs, with the proviso that the heterologous moiety is different from any of the fusion proteins CIIHGETAN123, HEFXTN123, HEFXTN1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antibody to a tumour. They can also be used for prevention or treating a disease or for diagnosis. The TTSE provides a stable structure which can act as a vehicle for a wide variety of conjugates. The present sequence represents a human tetranectin polypeptide fragment. The encoding nucleic acid sequence was amplified by PCR from the plasmid clone pT7H6FXTN123. This is used in the construction of E. coll expression vectors for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Trimeric polypeptide; tetranectin trimerising structural element; TTSE; fusion protein; ligand binding structure; toxin; enzyme; cytokine; artificial antibody; pharmacokinetic; pharmadynamic; gene therapy; transfection; imaging; tumour; human; tetranectin.
                                                                                                                      The invention relates to the design of trimeric polypeptides using polypeptide structural elements derived from the tetranectin protein family. The trimeric polypeptides constructed as a monomer polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                           construct comprise at least one tetranectin trimerising structural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

The invention relates to the design of trimeric polypeptides using polypeptide structural elements derived from the tetranectin protein cample of Timeric polypeptides constructed as a monomer polypeptide constructed as a monomer polypeptide construct comprise at least one tetranectin trimerising structural element (TTSE) which is covalently linked to at least one heterologus on object, the TTSE being capable of forming a stable complex with 2 other TTSE, with the proviso that the heterologous molety is different from any of the fusion proteins CIHPERTNI23, HERYNI23, HERYNI23, HERYNI23, HERYNI23, CONJUGATES with heterologous moleties such as a ligand binding conjugates with heterologous moleties such as a ligand binding conjugates with heterologous moleties such as a ligand binding conjugates with heterologous moleties such as a ligand binding conjugated bencetable label, an in situ activatable substance, a photo cross-linking agent, or a group facilitating conjugation of the construct to a target. They can be used as vehicles of a sembling antibody fragments into oligomeric or multivalent constructs can be used for target or pharmacokinetic and/or pharmacokinetic and/or pharmacokinetic pharmacokine constructs can be used for targeted gene therapy involving selective constructs can be used for targeted gene therapy involving selective constructs can be used for targeted gene therapy involving selective constructs can be used for targeted gene therapy involving or toxin-conjugated antibody to a tumour. They can also be used for prevention or treating a callor to tissue or for delivering an imaging or toxin-conjugated cat as a vehicle for a wide variety of conjugates. The present sequence creates as a vehicle for a wide variety of conjugates. The present sequence or expresents a HERXTIDE function protein sequence encoded by the plasmid
                                                                                                                                                                                                                                                                                                                                                                               New monomer polypeptide constructs for diagnosis and therapy comprise a tetranectin trimerising structural element covalently linked to at least one heterologous moiety for providing functional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Kastrup JS;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          activity
     NAME OF COLOR COLO
```

New monomer polypeptide constructs for diagnosis and therapy comprise a tetranectin trimerising structural element covalently linked to at least one heterologous molety for providing functional

Example 1; Page 59-60; 110pp; English.

```
The invention relates to the design of trimeric polypeptides using polypeptide structural elements derived from the tetranectin protein construct comprise at least one tetranectin trimerising structural constructs. With the proviso that the heterologous moiety is different from any of the fusion proteins CIMERTAN13, HERTAN13, CC CONJUGATES WITH heterologous moieties such as a ligand binding structure, a detectable label, an in situ activatable substance. CC conjugates with heterologous moieties such as a ligand binding conjugation of the monomer polypeptide construct or a group facilitating conjugation of the operations and properties or a proup an ease as vehicles constructs can be used for target or multivalent constructs can be used for targeted gene therapy involving selective constructs can be used for targeted gene therapy involving selective delivery of the material for transfection or infection of the specific coppulation of cells. They can also be used for prevention of the specific a collivery of the material for transfection or infection of the specific coppulation of cells. They can also be used for preventing a substance to a cell or tissue or for delivering an imaging or toxin-conjugated disease or for diagnosis. They can also be used for prevention of can confidence was a vehicle for a wide variety of conjugates. The present sequence confidence was amplified by PCR from the plasmid clone p77H6FXTN123. This is used in the construction of E. coll example in the construction of E. coll example in the construction of E. coll example in the construction of this 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Trimeric polypeptide; tetranectin trimerising structural element; TTSE;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          74.9%; Score 128; DB 20; Length 49; 78.8%; Pred. ```
The invention relates to the design of trimeric polypeptides using polypeptide structural elements derived from the tetranectin protein family. The trimeric polypeptides constructed as a monomer polypeptide construct comprise at least one tetranectin trimerising structural element (TTSE) which is covalently linked to at least one heterologous moiety, the TTSE being capable of forming a stable complex with 2 other TTSEs, with the provise that the heterologous moiety is different from any of the fusion proteins CIIH6FXTN123, H6FXTN123, H6FXTN12, H6FXTN12 (AAM94261 to AAM94264). The TTSE can be used for the construction of conjugates with heterologous moiety as ligand binding structure, a toxin, a detectable label, an in situ activatable substance, an enzyme, a radioactive moiety, a cytokine, a non-proteinaceous polymer, a photo cross-linking agent, or a group facilitating conjugation of the monomer polypeptide construct to a target. They can be used as vehicles for assembling antibody fragments into oligomeric or multivalent preselected pharmacokinetic and/or pharmadynamic properties. The constructs can be used for transfection or infection of the specific population of cells. They can also be used for delivering a substance to a cell or tissue or for delivering an imaging or toxin-conjugated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antibody to a tumour. They can also be used for prevention or treating a disease or for diagnosis. The TYSE provides a stable structure which can disease or wehicle for a wide variety of conjugates. The present sequence represents a HGFXTN12 fusion protein sequence. The specification claims that the heterologous moiety to which the TYSEs of the invention are linked to is specifically different from the present fusion protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New monomer polypeptide constructs for diagnosis and therapy comprise a tetranectin trimerising structural element covalently linked to at least one heterologous moiety for providing functional

The invention relates to the design of trimeric polypeptides using polypeptide structural elements derived from the tetranectin protein family. The trimeric polypeptides constructed as a monomer polypeptide construct comprise at least one tetranectin trimeris polypeptide construct comprise at least one tetranectin trimeris polypeptide construct comprise at least one tetranectin trimeris polypeptide construct comprise at least one heterologous moiety, the TTSE being capable of forming a stable complex with 2 other TTSEs, with the proviso that the heterologous moiety is different from any of the fusion proteins CliHGTYN123, HGFXTN123, HGFXTN12, HGFXTN123 (AAW94261 to AAM94264). The TTSE can be used for the construction of conjugates with heterologous moieties such as a ligand binding structure, a toxin, a detectable label, an in situ activatable substance, an enzyme, a radioactive moiety, a cytokine, a non-proteinaceous polymer, a photo cross-linking agent, or a group facilitating conjugation of the monomer polypeptide construct to a target. They can be used as vehicles for assembling antibody fragments into oligomeric or multivalent entities for generating chimmeric artificial antibodies having the material for transfection or infection of the specific constructs can be used for transfection or infection of the specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             population of cells. They can also be used for delivering a substance to a cell or tissue or for delivering an imaging or toxin-conjugated antibody to a tumour. They can also be used for prevention or treating a disease or for diagnosis. The TTSE provides a stable structure which can
                                                                                                                         Trimeric polypeptide; tetranectin trimerising structural element; TTSE; flusion protein; ligand binding structure; toxin; enzyme; cytokine; artificial antibody; pharmacokinetic; pharmadynamic; gene therapy; transfection; imaging; tumour; human; tetranectin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            act as a vehicle for a wide variety of conjugates. The present sequenc represents a H6FXtripb fusion protein sequence encoded by the plasmid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New monomer polypeptide constructs for diagnosis and therapy comprise a tetranectin trimerising structural element covalently linked to at least one heterologous moiety for providing functional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Kastrup JS;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Graversen NJH, Holtet TL,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to the design of trimeric polypeptides using polypeptide structural elements derived from the tetranectin protein family. The trimeric polypeptides constructed as a monomer polypeptide construct comprise at least one tetranectin trimerising structural element (TTSE) which is covalently linked to at least one heterologous construct comprise at least one tetranectin trimerising structural element (TTSE) which is covalently linked to at least one heterologous construct comprise in the proviso that the heterologous moiety is different from any of the fusion proteins CIHERYNNI23, HERYNNI23, HERYNNI2, HERYNNI23 (AMM94261 to AAM94264). The TTSE can be used for the construction of conjugates with heterologous moieties such as a ligand binding structure, a toxin, a detectable label, an in situ activatable substance, an enzyme, a radioactive moiety, a cytokine, a non-proteinaceous polymer, a protectoros-linking agent, or a group facilitating conjugation of the monomer polypeptide construct to a target. They can be used as vehicles for assembling antibody fragments into oligomeric or multivalent constructs can be used for targeted gene therapy involving selective delivery of the material for transfection or infection of the specific population of cells. They can also be used for delivering a substance to a cell or tissue or for delivering an imaging or toxin-conjugated attended a stable structure which can

The invention relates to the design of trimeric polypeptides using polypeptide structural elements derived from the tetranectin protein family. The trimeric polypeptides constructed as a monomer polypeptide construct comprise at least one tetranectin trimerising structural element (TTSE) which is covalently linked to at least one heterologous moiety, the TTSE being capable of forming a stable complex with 2 other TTSEs, with the provise that the heterologous moiety is different from any of the fusion proteins CIHGEXTN123, HGEXTN123, HGEXTN12, HGEXTN3 CONJUGATES with heterologous moieties such as a ligand binding structure, a toxin, a detectable label, an in situ activatable substance, an enzyme, a radioactive moiety, a cytokine, a non-proteinaceous polymer, a photo cross-linking agent, or a group facilitating conjugation of the monomer polypeptide construct to a target. They can be used as vehicles for assembling antibody fragments into oligomeric or multivalent
act as a vehicle for a wide variety of conjugates. The present sequence represents a H6FXtripB-UB (ubiquitin) fusion protein sequence encoded by the plasmid pH6FXtripB-UB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Trimeric polypeptide; tetranectin trimerising structural element; TTSE; fusion protein; ligand binding structure; toxin; enzyme; cytokine; artificial antibody; pharmacokinetic; pharmadynamic; gene therapy; transfection; imaging; tumour; human; tetranectin; CEA6.

                               preselected pharmacokinetic and/or pharmadynamic properties. The constructs can be used for targeted gene therapy involving selective delivery of the material for transfection or infection of the specific population of cells. They can also be used for delivering a substance to a cell or tissue or for delivering an imaging or toxin-conjugated antibody to a tumour. They can also be used for prevention or treating a disease or for diagnosis. The TTSE provides a stable structure which can act as a vehicle for a wide variety of conjugates. The present sequence represents a HGFXSCFV(CEA6)tripB fusion protein sequence encoded by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to the design of trimeric polypeptides using polypeptide structural alements derived from the tetranectin protein family. The trimeric polypeptides constructed as a monomer polypeptide construct comprise at least one tetranectin trimerising structural element (TYES) which is covalently linked to at least one heterologous moiety, the TYSE being capable of forming a stable complex with 2 other TYSEs, with the proviso that the heterologous moiety is different from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Trimeric polypeptide; tetranectin trimerising structural element; TTSE; fusion protein; ligand binding structure; toxin; enzyme; cytokine; artificial antibody; pharmacokinetic; pharmadynamic; gene therapy; transfection; imaging; tumour; human; tetranectin; CEA6.

AMM94261 to AAM94264). The TTSE can be used for the construction of conjugates with heterologous moieties such as a ligand binding structure, a toxin, a detectable label, an in situ activatable substance, an enzyme, a radioactive moiety, a cytokine, a non-proteinaceous polymer, a photo cross-linking agent, or a group facilitating conjugation of the monomer polypeptide construct to a traget. They can be used as vehicles for assembling antibody fragments into oligoment or multivalent entitles for generating chimeric artificial antibodies having preselected pharmacokinetic and/or pharmadynamic properties. The constructs can be used for transfection or infection of the specific population of cells. They can also be used for delivering a substance to a cell or tissue or for delivering an imaging or toxin-conjugated antibody to a tumour. They can also be used for prevention or treating a mitbody to a tumour. They can also be used for prevention or treating a disease or for diagnosis. The TTSE provides a stable structure which can a tas a vehicle for a wide variety of conjugates. The present sequence encoded by the

-! FUNCTION: Involved in DNA double-strand break repair (DSBR). The rad50/mrell complex possesses single-strand endonuclease activity and ATP-dependent coulcies as activity.
Rad50 provides an ATP-dependent control of mrell by unwinding and/or repositioning DNA ends into the mrell active site (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA repair; Hydrolase; ATP-binding; Colled coil; Complete proteome. 30 37 ATP (BY SIMILARITY). Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
